水龙兽—新种初步介绍

孙 艾 玲
（中国科学院古脊椎动物与古人类研究所）

1963年，中国科学院古脊椎动物与古人类研究所野外队在新疆准噶尔盆地南缘二、三迭纪地层中采集到一批爬行动物化石，其中多数是水龙兽类。正在进行修理的标本中，有一个保存在结核里的小型水龙兽个体。修理之后，发现头骨保存极为完好。它虽然代表的是一个年轻的个体，但很清楚与任何已知种有所区别。

这个标本采自新疆吉木萨尔东小龙口，层位是仓房沟岩系苇梁园子组。由于水龙兽是三迭纪早期的标准爬行动物化石，因此也可以确定苇梁园子组代表三迭纪的开始。

![Lystrosaurus youngi sp. nov. 头骨背视和侧视 ×1/2。](image)

头骨总长122毫米。很明显的特征是鼻骨呈弧状弯曲，不像其他大多数种类那样在额部前后之间呈角度折曲；前额骨不大发育；额骨表面平滑而下凹。眼孔大，但其上缘不向上高过于头骨背面。鼻孔位置较向前，没有显著的鼻孔后沟(Postnarial groove)。上颚骨突呈三角形，向下伸展，牙齿不大。

这一头骨从外表看来，与 Lystrosaurus curvatus 很相似，两者额部平滑地弯曲向下，没有眼孔间横棱。但 L. curvatus 的眼孔向上升，额骨表面下陷，在这个性质上，显得比我们的标本要进步一些。

与水龙兽属中较原始的种类，如 L. primitivus 和 L. owiceps 相比，我们的标本则比它们要进步些，因为在这个头骨上，已经出现了一个典型的水龙兽脸部，即头骨前部已显

PRELIMINARY REPORT ON A NEW SPECIES OF
LYSTROSAURUS OF SINKIANG

Sun Ai-lin
(Institute of Vertebrate Paleontology and Paleoanthropology, Academia Sinica)

A collection of Permo-Triassic reptiles was discovered from Sinkiang in 1963, in which, lystrosaurids were the majority. Among the prepared specimens, there is a small skeleton of Lystrosaurus well preserved in hard concretions. It is a young individual and differs apparently from the other species.

This specimen occurred at Tung-Hsiao-Lung-Kou, Jimusar, from the Lystrosaurus zone of the early Triassic.

The skull is 122 mm in total length. It is characterized by the smooth curvature of the frontal and nasal regions, the less developed prefrontals and the flat frontals. Orbits are large, not protrude above the level of the dorsal surface of the skull. Nasal openings situate somewhat anteriorly, no prominent post-narial grooves. Alveolar regions extend downward, with undeveloped tusk roots.

This specimen represents a fourth species from Sinkiang and a new name—Lystrosaurus youngi—is proposed.

The new species is quite similar in outline to L. curvatus in the smoothly curved facial region without mid-orbital ridge. But it shows its more primitive features in having unlifted orbits and unconcaved frontals.

To the primitive representatives—L. primiticus and L. oviceps, our species is distinguished by its more Lystrosaurus-like snout. The other known species from Sinkiang are distinct in having clear mid-orbital ridge, smaller orbits and posteriorly located nares.

The detailed description will be given later.
